Miscellaneous: Zsh: prompts

(last edit: 2001-03-18)
              You can alter your zsh 'PS1', 'PS2', 'PS3' and 'PS4' prompts via the command line or your
'~/.zshrc' file by resetting the value of the matching shell variable. This is e.g. '$PS1'
for the 'PS1' prompt.

E.g.:

user@host:~#export PS1="%m [%n] %d>"

Would generate a default prompt like this:

lowlife [jappe] /home/jappe>

This is how my '.zshrc' looks like:

```
----
export PS1="%m [%n] %d>"
setopt AUTOLIST
----
```

You can type the same command on the command line instead of putting it in your '~/.zshrc'.

Here are some options and explanations extracted from the 'zshparam' man page:

PS1   The primary prompt string, printed before a command is read; the default is "%m%# ".

```
                 %d
                 %/     Present working directory ($PWD).
                 %M     The full machine hostname.
                 %m     The hostname up to  the  first  '.'.
                        An  integer  may  follow  the '%' to
                        specify how many components  of  the
                        hostname are desired.
                 %@     Current  time  of  day,  in 12-hour,
                        am/pm format.
                 %T     Current time of day, in 24-hour for-
                        mat.
                 %*     Current  time of day in 24-hour for-
                        mat, with seconds.
                 %n     $USERNAME.
                 %w     The date in day-dd format.
                 %W     The date in mm/dd/yy format.
                 %D     The date in yy-mm-dd format.
```

PS2   The secondary prompt, printed when the shell needs more information to complete
       a command.   Recognizes the same escape sequences as $PS1. The default is "%_> ",
       which displays any shell constructs or quotation marks which are currently
       being processed.

PS3   Selection prompt used within a select loop. Recognizes the same escape sequences
       as $PS1. The default is "?# ".

PS4   The execution trace prompt. Default is "+".
